

该文档实现了一种基于格的后量子累加器，核心算法为 Add, Delete, MemWitUp, MemVer, MemWitSync。

其他的算法，如 $F_k(x, acc)$, $EvalF$, $EvalFx$, $SampleLeft$ 都是核心算法需要的前置算法。

参数值： $n=1$, $\ell = 32$, k 是 128bit, $d=2096$, q 约为 2^{100} , $m=10$, m' 约为 100。文档里面有部分参数值不太对，但是这个文档和 `/home/wkk/pq_ac/lattice-anonymous-credentials` 里的参数不完全相同，你可以自己调一下。

Given let $\tilde{q} = \lceil \log_2 q \rceil$ and

$$\mathbf{g}^\top = (1, 2, 2^2, \dots, 2^{\tilde{q}-1}) \in R_q^{1 \times \tilde{q}}$$

The gadget matrix of base b is defined by $\mathbf{G} = \mathbf{I}_n \otimes \mathbf{g}^\top \in R_q^{n \times m}$. In

addition, there exists an efficient function $\mathbf{G}^{-1}: R_q^{n \times t} \rightarrow R_q^{m \times t}$ such

that for any $\mathbf{A} \in R_q^{n \times t}$, we have $\mathbf{G} \cdot \mathbf{G}^{-1}(\mathbf{A}) = \mathbf{A}$.

Algorithm : $F_k(x, acc) \rightarrow r$:

这是一个伪随机函数，对于同一个主密钥 k ，只要输入的参数（如特定的 x 和 acc ）完全一致， $F_k(x, acc)$ 无论执行多少次，计算多少次，输出的随机数种子 r 必定 100% 相同。

Algorithm : $EvalF(1_x, \mathbf{B})$ and $EvalFx(1_x, \mathbf{B}, y)$

/* 对于 $EvalF(1_x(y), \mathbf{B}) \rightarrow \mathbf{B}_{1_x(y)}$, $EvalFx(1_x(y), \mathbf{B}, y) \rightarrow \mathbf{H}_{1_x(y), y}$, 目的是生成满足

$(B - x^T \otimes G) \cdot H_{1_x(y), y} = B_{1_x(y)} - 1_x(y) \cdot G$ 和 $\|H_{1_x(y), y}\|_\infty \leq b - 1$ 这两个条件的 $\mathbf{B}_{1_x(y)}$

和 $\mathbf{H}_{1_x(y), y}$ */

For any $\ell \in \mathbb{N}$, binary vectors $\mathbf{x}, \mathbf{y} \in \{0, 1\}^\ell$, and matrix $\mathbf{B} =$

$[\mathbf{B}_0 \mid \dots \mid \mathbf{B}_{\ell-1}] \in R_q^{n \times m\ell}$, $\mathbf{x} = \{x_0, x_1 \dots x_{\ell-1}\}$, $\mathbf{y} = \{y_0, y_1 \dots y_{\ell-1}\}$, let

$$\mathbf{1}_{\mathbf{x}}(\mathbf{y}) = \begin{cases} 1 & \text{if } \mathbf{x} = \mathbf{y} \\ 0 & \text{otherwise} \end{cases}, \quad \mathbf{D}_i = \begin{cases} \mathbf{B}_i & \text{if } x_i = 1 \\ \mathbf{G} - \mathbf{B}_i & \text{if } x_i = 0 \end{cases}, \text{ and } \delta_{x,y} = \begin{cases} 1 & \text{if } x = y \\ 0 & \text{otherwise} \end{cases}$$

We have $\mathbf{EvalF}(\mathbf{1}_{\mathbf{x}}, \mathbf{B}) = \mathbf{D}_0 \cdot \mathbf{G}^{-1} \left(\mathbf{D}_1 \cdot \mathbf{G}^{-1} \left(\mathbf{D}_2 \cdot \mathbf{G}^{-1} (\dots \mathbf{G}^{-1}(\mathbf{D}_{\ell-1})) \right) \right)$ and

$$\mathbf{EvalF}_x(\mathbf{1}_{\mathbf{x}}, \mathbf{B}, \mathbf{y}) = \begin{bmatrix} (-1)^{(1-x_0)} \cdot \mathbf{G}^{-1} \left(\mathbf{D}_1 \cdot \mathbf{G}^{-1} (\mathbf{D}_2 \dots \mathbf{G}^{-1}(\mathbf{D}_{\ell-1})) \right) \\ (-1)^{(1-x_1)} \cdot \delta_{x_0, y_0} \cdot \mathbf{G}^{-1} \left(\mathbf{D}_2 \cdot \mathbf{G}^{-1} (\dots \mathbf{G}^{-1}(\mathbf{D}_{\ell-1})) \right) \\ \vdots \\ (-1)^{(1-x_{\ell-2})} \cdot \delta_{x_0, y_0} \delta_{x_1, y_1} \dots \delta_{x_{\ell-3}, y_{\ell-3}} \cdot \mathbf{G}^{-1}(\mathbf{D}_{\ell-1}) \\ (-1)^{(1-x_{\ell-1})} \cdot \delta_{x_0, y_0} \delta_{x_1, y_1} \dots \delta_{x_{\ell-3}, y_{\ell-3}} \delta_{x_{\ell-2}, y_{\ell-2}} \cdot \mathbf{I}_m \end{bmatrix}$$

Algorithm : SampleLeft($A, M_1, R_A, u, s; r_a$)

1. 采样一个满足条件足够短的向量 e_2
2. 得到 $e_1 \xleftarrow{R} \text{TSamplePre}(R_1, R_2, A_a, u - (M_1 \cdot e_2), t, s, r_a)$, $R_A = (R_1, R_2)$
3. output $e \leftarrow (e_1, e_2)$

Output: $F_1 := (A \mid M_1)$.

这个算法底层核心采样思想来自/home/wkk/truncated-sampler/signature_truncated的 truncated-sampler 算法，但是实际在实现时需要进行更改算法或参数，根据 truncated-sampler 算法重新写一个 TSamplePre 算法， r_a 代表来自算法外部输入的随机种子，当包括 r_a

的所有输入相同时，输出相同，即算法是确定性算法。其中 M_1 在传入时应该是

$B_a - x^T \otimes G$, A 传入时应该是 $[I_a \mid A_a \mid TG_H - (R_1 + A_a R_2)]$ 。最终实现了 $e \in \Lambda_q^u(F_1)$, $(A \mid M_1) \cdot e = u \mod q$ 。

以下算法的参数完全统一，包括输入输出的参数。

其中， $\mathcal{A}$ 和 acc 为累加器值， s_x 为见证， x 是撤销句柄， $upmsg$ 是广播消息，

A应该是 $[I_d|A_a|TG_H - (R_1 + A_aR_2)]$ 不确定你再查看一下，

Algorithm : AccGen(pp)//参数与陷门生成

(1)Compute $(A_a, R_A) \leftarrow \text{TrapGen}(1^n, 1^m, q)$ 实际上因为底层调用来自truncated – sampler 算法，所以 A_a 与 R_A 的生成应该查看truncated – sampler 算法的矩阵与陷门生成

(2)Sample $B_a \leftarrow R_q^{n \times \ell m'}$, $(acc_0, u_a) \leftarrow R_q^{2n}$

(3) $k_a \leftarrow (0, 1^\lambda)$

(4)Initialize an empty dictionary $DX: M \rightarrow \{Add, Del, \perp\} \times N$ and a counter $ctr := 0$.

(5)Set $\mathcal{A}_0 := acc_0$, and $st_a := (k_a, ctr, acc_0, DX)$.

Output: $(R_A, \mathcal{A}_0, st_a)$.

Algorithm : Add($A, B_a, R_A, st_a, \mathcal{A}, x$)//句柄 x 对应者加入累加器

(1) $(k_a, ctr, acc_0, DX) := st_a, acc := \mathcal{A}, x \in M$

(2)Parse $(Op, i) := DX[x]$, and if $Op \neq \perp$, abort. 实际上 x was already added or deleted

(3)Compute $r_a \leftarrow F_{k_a}(x, acc)$.

(4)Compute $s_x \leftarrow \text{SampleLeft}(A, B_a - x^\top \otimes G, R_A, acc, s; r_a)$.

(5)Set $DX[x] := (Add, ctr)$, $upmsg = (Add, \perp)$.

(6)Set $st'_a := (k_a, ctr, acc_0, DX)$

Output: $(\mathcal{A}, s_x, upmsg, st'_a)$.

Algorithm: Delete($A, B_a, u_a, R_A, st_a, \mathcal{A}, x, s_x$)

//累加器删除句柄 x 对应者，且更新累加器值

(1) $(k_a, ctr, acc_0, DX) := st_a, acc := \mathcal{A}, x \in M$

(2) If $ctr > \gamma$, abort.

□ We have exceeded the allowed number of deletions

(3) Parse $(Op, i) := DX[x]$, and if $Op \neq Add$, abort.

□ x was already deleted or never added

(4) Compute $B_{1_x} \leftarrow EvalF(1_x, B_a)$

(5) $acc' \leftarrow acc + B_{1_x} \cdot G^{-1}(u_a)$

(6) Set $ctr' \leftarrow ctr + 1$ and $\mathcal{A}' := acc'$.

(7) Set $DX[x] := (Del, ctr)$, $upmsg := (Del, x)$, and $st' := (k_a, ctr', acc_0, DX)$.

Output: $(\mathcal{A}', upmsg, st'_a)$.

Algorithm: MemWitUp $(A, B_a, u_a, x, s_x, upmsg)$

//成员根据广播内容更新自身见证

(1) $(Op, y) := upmsg$

(2) If $Op = Add$: do nothing.

Else, if $Op = Del$:

– Compute $H_{1_y, x} \leftarrow EvalFx(1_y, B_a, x)$

– $s'_x \leftarrow s_x + \left[0_{m' \times m} \mid H_{1_y, x}^\top \right]^\top \cdot G^{-1}(u_a)$

– Output: s'_x

Algorithm: MemVer $(A, B_a, u_a, \mathcal{A}, x, s_x)$

//成员见证与句柄 x 的验证

(1) $acc := \mathcal{A}$, do the following:

If $[A \mid B_a - x^\top \otimes G] \cdot s_x = \text{acc}$ and $\|s_x\| \leq \beta$, return 1.

Otherwise, return 0.

Algorithm: MemWitSync($A, B_a, u_a, R_A, st_a, \mathcal{A}, x$)

//为成员重新创建一个，与当时发放的见证一模一样的见证

(1) Given $(k_a, \text{ctr}, \text{acc}_0, DX) := st, \text{acc} := \mathcal{A}$

(2) Parse $(Op, i) := DX[x]$, and if $Op \neq \text{Add}$, abort. x is not in the accumulator

(3) Let $Z_0 = \{y \in \mathcal{M} : (Op, j) := DX[y], Op = \text{Del}, 0 < j \leq i\}$.

$\boxtimes$ The set of elements deleted before x was added

(4) Let $Z_1 = \{y \in \mathcal{M} : (Op, j) := DX[y], Op = \text{Del}, i < j \leq \text{ctr}\}$.

$\boxtimes$ The set of elements deleted after x was added

(5) Compute $\text{acc}_i \leftarrow \text{acc}_0 + \sum_{y \in Z_0} \text{EvalF}(1_y, B_a) \cdot G^{-1}(u_a)$.

$\boxtimes$ We cover the accumulator's value from when x was added

(6) Compute $r_a \leftarrow F_{k_a}(x, \text{acc}_i)$.

(7) Compute $s_x \leftarrow \text{SampleLeft}(A, B_a - x^\top \otimes G, R_A, \text{acc}, s; r_a)$.

(8) For each $y \in Z_1$, do:

– Compute $H_{1_y, x} \leftarrow \text{EvalFx}(1_y, B_a, x)$.

– $s_x \leftarrow s_x + \left[0_{m' \times m} \mid H_{1_y, x}^\top \right]^\top \cdot G^{-1}(u_a)$.

Output: s_x
